

DOM EXERCISE 4

Skills: forms, adding elements, removing elements, event delegation and/or event target

Create a form with two inputs: a **number** input (or **range** input) for count and a **select** input for the type of coin: Penny, Nickel, Dime, or Quarter.

- When the form is submitted, add the specified number of “coins” to the page, each with text from the “Which coin?” input. For example, the diagram below shows what would be displayed after submitting the form.

How many?

Which coin?

Dime	v
------	---

Make Money!

Dime Dime

- Whenever the form is submitted, it should continue adding additional coins, not removing the previous coins.
- Finally, whenever a coin is clicked, remove just that the clicked coin from the page.

Extended Challenges:

- Use different colors, sizes, or images for the different coin options.
- Also display a total value for the coins currently shown. Make sure it stays up-to-date when coins are added and removed.
- Replace the **select** with a group of **radio** buttons
